QUALITY ASSESSMENT REPORT — ISO 25010

1. Cover Information

App 1: LinkedIn (Version 9.1.538)

App 2: Indeed (Version 307.1)

Platform: iOS

Device: iPhone 11

OS Version: iOS 26.4.1

Evaluator Name: Mudeer Ali

Student ID: FA23-BSE-073

Date: 21-04-2026 / 25-04-2026

Pair: Custom (LinkedIn vs Indeed)

---

2. App Overviews

LinkedIn is a professional networking application designed for career development, recruitment, and industry engagement. Its primary users include professionals, recruiters, and organizations. The application provides features such as profile management, job searching, messaging, and content sharing. It operates as a hybrid platform combining social networking with job services.

Indeed is a job search application focused primarily on helping users find and apply for employment opportunities. Its target audience is job seekers and employers. Core features include job search, resume upload, job alerts, and application tracking. Compared to LinkedIn, Indeed is more specialized and task-focused.

The key difference lies in scope: LinkedIn offers a broader ecosystem, while Indeed focuses on efficiency in job searching.

---

3. Evaluation Methodology

The evaluation follows the **ISO/IEC 25010 software quality model**, using a **1–5 Likert scale**:

5 = Excellent

4 = Good

3 = Acceptable

2 = Poor

1 = Unacceptable

Each app was tested under the same conditions:

Device: iPhone 11

Network: consistent mobile/WiFi conditions

Duration: ~50 minutes per app

Testing methods included:

Stopwatch (measuring load times in seconds)

Device settings (battery and data usage)

Manual interaction (navigation, tasks, edge cases)

Connectivity testing (Airplane mode)

---

4. Completed Checklists (Summary)

LinkedIn

- Functional Suitability: 5
- Performance Efficiency: 3
- Compatibility: 4
- Usability: 4
- Reliability: 4

- Security: 4
- Maintainability: 3
- Portability: 5
  ➡ **Total: 4. 17 / 5.00**

Evidence / Observations:

- Observation 1: App launch time measured ~10 seconds, exceeding expected <3 seconds.
- Observation 2: Feed loading delayed under 4G network (~5 seconds).

Indeed

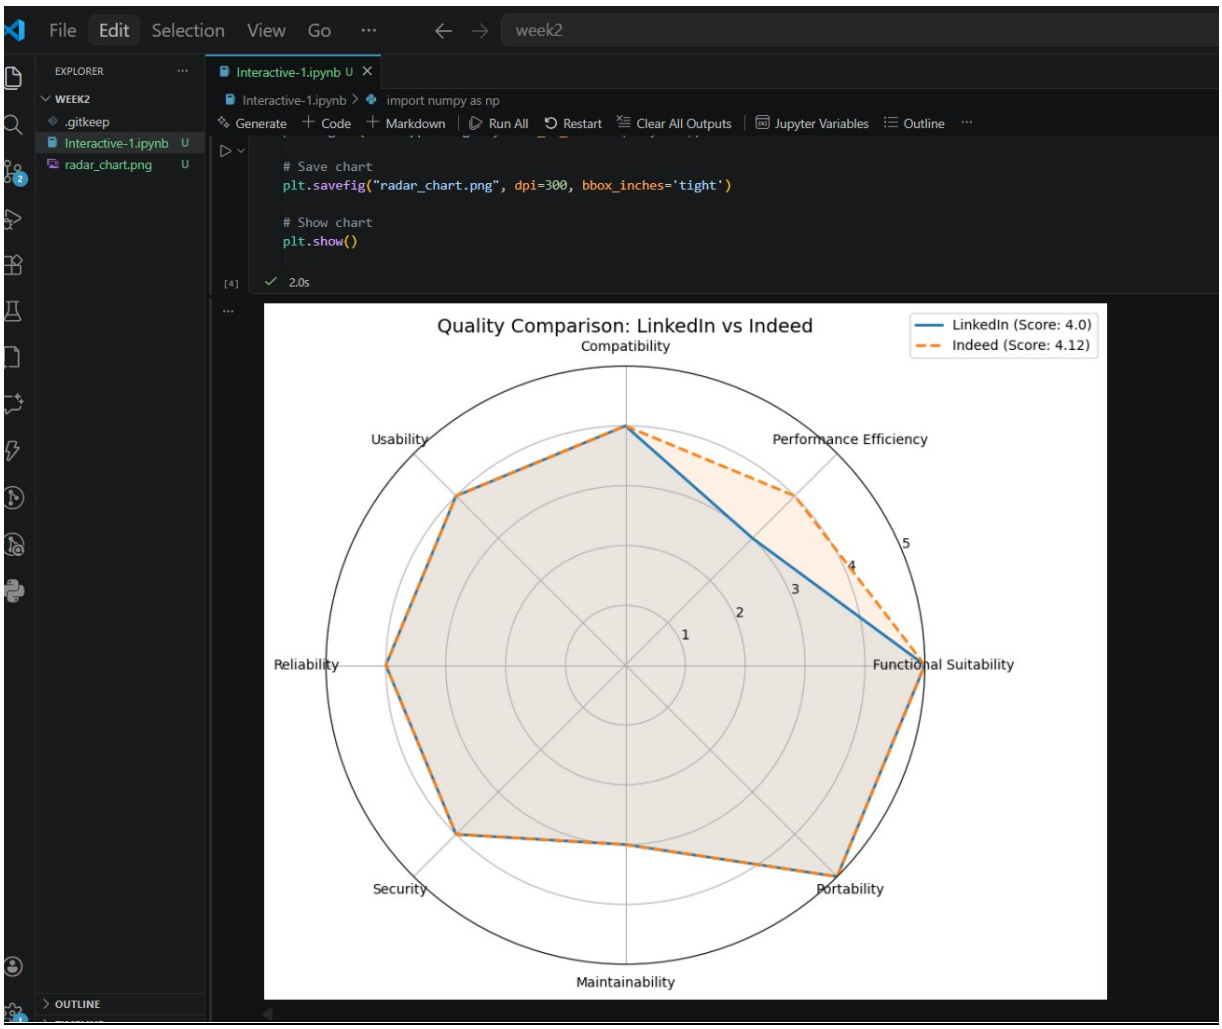
- Functional Suitability: 4
- Performance Efficiency: 3
- Compatibility: 4
- Usability: 4
- Reliability: 4
- Security: 3
- Maintainability: 3
- Portability: 5
  ➡ **Total: 3.78 / 5.00**

Evidence / Observations (Indeed):

- Observation 1: Job search takes ~2 seconds normally, up to 20 seconds on slow network.
- Observation 2: App does not function without internet (offline limitation).

---

5. Quality Profile Chart



6. Comparative Analysis

LinkedIn achieved a weighted quality score of **4.17/5.00**, compared to Indeed's **3.78/5.00**, resulting in a margin of **0.30 points**. This indicates that LinkedIn provides slightly higher overall software quality. The difference is primarily driven by LinkedIn's stronger functional capabilities and security mechanisms.

The largest quality gaps appear in **Functional Suitability, Security, and Maintainability**. LinkedIn outperforms Indeed in Functional Suitability due to its broader feature set, including networking and content sharing, whereas Indeed is limited to job searching. In terms of Security, LinkedIn offers stronger mechanisms such as two-factor authentication and biometric login, while Indeed has more limited implementation. However, Indeed performs slightly better in Maintainability due to relatively better update consistency, although both applications suffer from generic changelog descriptions.

A notable trade-off exists between **functionality and performance efficiency**. LinkedIn's rich feature set contributes to slower performance, as observed in longer loading times and higher battery consumption. In contrast, Indeed, being more focused, demonstrates slightly better responsiveness in some scenarios but lacks advanced features. This reflects a common trade-off in software systems where increased functionality can negatively impact performance.

Another observation is that both applications show similar results in **Usability and Reliability**, indicating that industry standards for user interface design and stability are consistently applied across both platforms. However, both apps show limitations in offline functionality, suggesting a shared dependency on network connectivity.

Based on the evaluation, LinkedIn is recommended for users seeking a comprehensive professional platform that combines networking and job searching. On the other hand, Indeed is more suitable for users who require a simple, focused job search experience without additional features.

---

7. Recommendations

LinkedIn — Recommendation 1

LinkedIn should optimize app startup and feed loading speed in order to improve Performance Efficiency from its current rating of 3 to a target of 4. Currently, the application takes significantly longer than expected to launch and load content, especially on older devices. This change would reduce waiting time and improve responsiveness, leading to a smoother user experience.

LinkedIn — Recommendation 2

LinkedIn should provide detailed and transparent changelogs in order to improve Maintainability from its current rating of 3 to a target of 4. Currently, update descriptions are generic and do not specify bug fixes or improvements. This change would enhance transparency and allow users and developers to better understand updates.

Indeed — Recommendation 1

Indeed should implement offline functionality by caching previously viewed job listings in order to improve Functional Suitability from its current rating of 4 to a target of 5. Currently, the

application becomes unusable without an internet connection. This change would allow users to access important job information anytime, improving usability.

Indeed — Recommendation 2

Indeed should optimize job search performance under slow network conditions in order to improve Performance Efficiency from its current rating of 3 to a target of 4. Currently, job searches can take up to 20 seconds in poor network conditions. This improvement would significantly enhance efficiency and user satisfaction.====

THE END: -
